

bimap::bidirectional  
\_map::at

bimap::bidirectional  
\_map::contains

bimap::bidirectional  
\_map::emplace

bimap::bidirectional  
\_map::erase

bimap::bidirectional  
\_map::end

```
graph LR; A[bimap::bidirectional_map::at] --> D[bimap::bidirectional_map::end]; B[bimap::bidirectional_map::contains] --> D; C[bimap::bidirectional_map::emplace] --> D; E[bimap::bidirectional_map::erase] --> D;
```

The diagram illustrates the relationship between four methods of the `bimap::bidirectional_map` class and its `end` method. On the left, four white rectangular boxes are stacked vertically, each containing the name of a method: `bimap::bidirectional_map::at`, `bimap::bidirectional_map::contains`, `bimap::bidirectional_map::emplace`, and `bimap::bidirectional_map::erase`. On the right, a single gray rectangular box contains the name of the `end` method: `bimap::bidirectional_map::end`. Four blue arrows originate from the right side of each of the four white boxes and point directly to the left side of the gray box, indicating that these four methods are related to or point to the `end` method.
